Focused Tripollar Radiofrequency uses high density and low energy to heat dermal (skin) layers which encourages the production of collagen and elastin. This results in tighter and smoother skin.

Celluma Light Therapy is FDA- cleared, non UV, low level phototherapy that improves cellular health to reduce the signs of aging and eliminate acne. In clinical studies, Red Light Dominant (640 nm) Phototherapy has been shown to increase production of both elastin and collagen, thus increasing skins radiance while decreasing wrinkles. Blue Light Dominant (415 nm) Phototherapy causes self destruction of acne-causing *P. Acnes* bacteria.

Dermaplaning is a form of mechanical exfoliation where the blade lightly sloughs off cellular build up and vellus hair (peach fuzz) in addition to restoring your skin's natural glow. Dermaplaning also stimulates collagen production and elastin while leaving the skin smoother and able absorb product better.
